

What we learned at the last public meeting

At the public meeting in May 2006, we asked participants what type of access would best serve the future needs of the corridor. The most common answers included:

- Expressway, including frontage and backage roads
- Traffic signals every mile now, but with the long-term goal of an expressway without signals
- Traffic signals every mile

We also learned what was most important to consider when choosing an access management strategy:

- Safety
- Travel time
- Speed

These responses helped the study team determine the criteria for evaluating alignment and access options for the corridor.
